

`std::true_type`

`std::conditional< bool
(P1::value), conjunction
< Ps... >, P1 >::type`

`testing::internal::
conjunction< P1, Ps... >`

```
graph LR; A[testing::internal::conjunction< P1, Ps... >] --> B[std::true_type]; A --> C[std::conditional< bool (P1::value), conjunction < Ps... >, P1 >::type];
```

The diagram illustrates the relationship between three C++ type expressions. A central gray box on the right contains the expression `testing::internal::conjunction< P1, Ps... >`. Two blue arrows originate from this box: one points to a white box at the top left containing `std::true_type`, and the other points to a white box at the bottom left containing `std::conditional< bool (P1::value), conjunction < Ps... >, P1 >::type`.
